

Valtech

Software and E-business development

Valtech provides complete end-to-end services for the provision of bespoke software solutions. Since its formation in 1995, application development has been Valtech's core business and they have led the way in a number of technology and process advances.

Valtech's services include early visioning and business case development, requirements identification and elaboration, proof-of-concept, bespoke software development, software testing and implementation and application support and maintenance. In addition, data migration services, which are highly bespoke by nature, are fundamental supporting services which Valtech has provided for large-scale migrations in the public sector. Integration of new applications into legacy environments or legacy applications into new enterprise environments is often a significant requirement for which Valtech has earned an exceptional reputation.

Their practical experience also assists organisations to improve software development processes: they provide training and coaching to many global clients and have a world-wide reputation for the advancement of software development techniques.

Valtech has a track record in applying agile methods to large-scale projects. High failure rates in traditional projects are often due to a reliance upon detailed requirements being specified and contracted for, whilst testing is left too late in the cycle. With Valtech's approach quality has an early focus, requirements are delivered in priority order and testing activities are embedded within the process, with significant reduction in project risk.

Valtech is a Microsoft Gold Partner and is engaged with many other technology vendors. Valtech is also committed to Open Source as a way of ensuring quality, whilst minimising costs.
